

The level 7 toilet has motion detector crammed on every surface. The motion of the door opening lights the toilet and as I step inside, my passing hand sets off the powerful dyson hand dryer. Startled, I turn around to see what the noise is.

By doing so I activate the ridiculously sensitive tap which starts running, I step back and accidentally flush the toilet by activating its proximity sensor. We are surrounded by sensors, eager to create physical responses to human presence. Our bodies and the spaces we exist in are quantified and codified by the digital sensors that surround us.

This was the starting point of my project as I thought the idea of our physical spaces being compiled into 'data' could act as a platform for some very interesting interaction design.
