I copied all of the website files and replaced the cursor with the key image file. This means that once the user collects the key, they will carry it around the website until they go back to the locked folder.

As this is a duplicate file of the locked folder page, I replaced the error message of the original page with a link to a page with an un-locked folder image.

Once the secret folder is unlocked, a 'Human Certificate Generator' win-dow pops up - styled with Minecraft stone blocks and a barbed wire tab.

I decided to have some fun with the graphic design. A combination of coming to the end of term and losing the plot a bit, embracing the wacky-ness of previous Net.Art work, and committing to the absurdism of synthetic CAPTCHAs. The user should feel like they've unlocked something special.

That they haven't just wasted the last 5 minutes just to be met by more formal document pages.

I think the experimental style lends itself to that.

Playing around with the visual style of these windows really got me through. The barbed wire tab might be my favourite aspect of the entire project.
